

Abstract

An LCD display similar to an automobile's television screen, 5x4x1 which is mounted on the back of a seat's head rest or on a flip-down screen that rests from the roof of the automobile. This LCD television screen is mounted behind the seat of a person that is seated in front of the viewer wanting to view the satellite transmitted sports event. The screens are attached to the back of the seats with a strong Velcro adhesive. The LCD screens are connected to receivers that are provided by a satellite-based company, which typically installs a small dish and receiver towards any television at home or in a business. The receiver transmits satellite signal to the particular LCD screen via RCA cables, which input and output on both the LCD screen, and receiver. The receivers are interconnected to the LCD screens. Remote is attached with Velcro to top of receiver.
